Two Additional Features we added:

- Friends: Users are capable of sending friend requests to other users of the program that must be accepted by the recipient of the request in order for both users to become friends. Users may also check which users they are friends with and also delete friends they already have.
- Blocking: Users may block other users, check who they have blocked and unblock users. Blocking will prevent them and that user from messaging one another.

Limits:

- Regex: We were considering adding regex for the password creation and for making limitations of special characters, but we had other obligations that forced us to focus on the core aspects of the project.
- Connections: This was a proposed extra feature that would have been added to the friend feature for a user to be able to check who was friends with their friends. We ultimately decided to go the route of creating the request system as the additional feature and did not add this one because of other obligations that only allowed us enough time to do only one additional feature for the friend feature.

NOTE: We were planning on having individual log files per conversation between users, but after realizing the assignment instructions specify a file name, we have both separate log files in the Logs directory, and a combined one (message_log.txt) outside of the Logs directory.
